Project Description

The Boundary Creek Timber Harvest Plan is a 453-acre project located within the SF Noyo River Watershed. This project will utilize single tree selection with small openings (less than ¼ acre) to promote coast redwood sprouting. This will create a new generation of redwoods while maintaining and improving forest health and increasing fire resiliency. The project will sustainably harvest ~35% of conifers across the plan.

Recreation

Jackson Demonstration State Forest (JDSF) plans these harvests to minimize visual aesthetic impacts, timing of area closures, and considers opportunity for improvements to areas popular with recreationists. This harvest plan is laid out to minimize the visual impact from Road 300, and to maintain the conifer overstory aesthetic that draws visitors to the Camp 1 recreation area.

Demonstration and Research

- Upgrade bridge and watercourse crossings to reduce erosion and allow salmon access to upper habitat reaches.
- Create a shaded fuel break along JDSF Road 380 and emergency egress route on Road 300 to increase fire preparedness for both the Forest and neighboring communities.
- Demonstrate timber management that maintains the wildlife, water quality, and recreational values of the coastal redwood forest.
